

ABSTRACT

The present invention features protective eyewear comprising first and second eyepieces formed of uniform material that is substantially impervious to light, wherein the first and second eyepieces each comprise an opaque eye cup and a transparent
5 ultraviolet light blocking lens integrally formed with the eye cup to create or provide a unitary eye cup/lens combination; and a nose bridge removably coupled to each of the first and second eyepieces via an attachment means that may also be a dynamic attachment means that facilitates vector positioning of the eyepieces about the nose
bridge for a more customized, ergonomically correct fit of the protective eyewear for
10 multiple users.
